

Tension/compression force transducers with thin-film sensor

Accuracy: 0,2 %
Output signals: 4...20 mA; 2-wire,
 0...10 VDC; 3-wire

Optional ATEX/IECEX
 Ex II 2G Ex ib IIC T4/T3

Optional for SIL3-Applications
 with 2-channel PC control

Description

In addition to our force transducer program with bonded foils, a new force transducer with a welded thin film sensor was developed. The usage of standardised sensors, which are welded into the measuring element, makes an automated manufacturing possible. Combined with an accuracy of 0.2%, the new tension / compression force transducers are also of interest for OEM applications due to the attractive price- performance ratio.

Thin film sensors, produced by very modern manufacturing technology, have all advantages of the conventional bonded foil strain gauges, but without having their substantial disadvantages (temperature drifts of the glue and creeping).

Tension / compression force transducers can be applied directly into the force flux. They are used for weight measuring or as an overload protection. In machineries they are used to monitor press-capacities, clamping forces. Mounted indirectly they can be used as torque supports in order to supervise momentums.

Different output signals are available. These force transducers fulfil the regulations of EMC according to directive EN 61326.

ATEX/IECEX (Option)

Only equipment and protective systems with the corresponding certification and markings are to be put into operation in potentially explosive areas. Our force transducers with a thin-film measuring cell and integrated amplifier now have approval according to directive 94/9/EC in equipment group II (non-mining products), category 2G for zones 1 and 2 (gases). Other zones on request.

SIL-3 (Option)

In cooperation with the TÜV Süddeutschland a special security electronics has been developed for theatre and stage applications. It fulfils security standard SIL 3 with a 2-channel PC control in connection.

This international security standard for systems and processes is based on the standards IEC 61508 and 61511. The latter is used for ascertaining risk potentials of (engineering) systems. Depending on the potential existing risk a risk reduction has to be made. If automation components are used for that, they have to fulfil the demands of IEC 61508.

Both standards subdivide systems and risk reducing actions in four security steps: **SIL1...SIL4 (Safety Integrity Level)** – from small up to very high risks. If persons are allowed to stay under hanging loads, e.g. in theatres, security level 3 (SIL 3) is valid.

UL-Certification (Option)

tec sis force transducers are also available with UL approval.

FM and CSA Approval submitted.

Features

- thin film implants (instead of conventional bonded foil strain gauges)
- corrosion free stainless steel
- integrated amplifier
- small temperature drift
- high long term stability
- high shock and vibration resistance
- for dynamic or static measurements
- good repeatability
- easy to install

ATEX/IECEX (Option)

- for Zone 1 and 2
- Ex II 2G Ex ib IIC T4/T3

SIL-3 (Option)

- Security electronic
- SIL-3 approval with 2-channel PC control; Certification: TÜV-Süd- No. Z-IS-ATA3-MAN 6000219499 acc. to EN 62061:2005

Measuring ranges

Tension and compression forces
 from 1 kN ... 100 kN

Applications

- hoists, cranes
- screw down forces in machinery
- process automation
- mechanical engineering and machinery

ATEX/IECEX (Option)

- Mining
- Chemical and petrochemical industries
- Dedusting and filtration units

SIL-3 (Option)

For theatre and stage design:

- Above-stage machinery
- Below-stage machinery
- Point hoists
- Bar hoists

Specific information

- Counter nuts included

Model: F2301, F23C1

Brief description SIL-3

Amplifier-Electronics 4...20mA or 0...10V
for SIL-3 applications with 2-channel PC control
(Certified by TÜV Süddeutschland, Germany)

Force Transducers, which are based on strain gauges, are working with four variable resistors ($R_1...R_4$) connected to a Wheatstone Bridge. Caused by deformation of the body the respective opposite resistors are lengthened or compressed in the same way. This results in an unbalanced bridge and a diagonal voltage U_0 .

This well proven design has been amended by an additional resistor R_7 in order to monitor the condition of the amplifier unit and signal path. This resistor is connected as a shunt to resistor R_5 by a relay contact (a) as soon as an excitation voltage U_r appears at relay A.

Fig.

The connection of resistor R_7 will always result in a defined unbalancing of the zero point (diagonal voltage) of the Wheatstone Bridge.

An external independent control unit activates relay A which changes the output by a certain value. Because of security reasons the control unit has to be a 2-channel one. When the expected change of the output signal is detected it can be assumed that the whole signal path (Wheatstone Bridge – amplifier – output) works well. If it does not appear it can be concluded that there is a defect in the signal path.

The standard adjustment of force transducers with current output for overload control is e.g.:

With activating the check relay a fixed signal jump of 8 mA will exceed the overload limit in every working condition. The measurement's upper limit of 20 mA however will never be reached. This makes the checking of the signal jump possible.
